

## **PRODUCT INFORMATION**

Target IL17A

**Synonyms** CTLA-8;CTLA8;IL-17;IL-17A;IL17;ILA17

**Description**Recombinant Human IL17A Protein with C-

terminal human Fc tag

Delivery In Stock
Uniprot ID Q16552
Expression Host HEK293

Tag C-Human Fc Tag

Molecular Characterization

Storage & Shipping

**Background** 

Purity

IL17A(Gly24-Ala155) hFc(Glu99-Ala330)

The protein has a predicted molecular mass of 41.3 kDa after removal of the signal peptide.Th

41.3 kDa after removal of the signal peptide. The apparent molecular mass of IL17A-hFc is approximately 35-55 kDa due to glycosylation.

The purity of the protein is greater than 95% as determined by SDS-PAGE and Coomassie blue

staining.

Lyophilized from sterile PBS, pH 7.4. Normally 5 %
- 8% trehalose is added as protectants before
lyophilization. Please see Certificate of Analysis

for specific instructions of reconstitution. Store at -20°C to -80°C for 12 months in lyophilized form. After reconstitution, if not intended for use within a month, aliquot and store

at -80°C (Avoid repeated freezing and thawing). Lyophilized proteins are shipped at ambient

temperature.

This gene is a member of the IL-17 receptor family which includes five members (IL-17RA-E) and the encoded protein is a proinflammatory cytokine produced by activated T cells. IL-17A-mediated downstream pathways induce the production of inflammatory molecules, chemokines, antimicrobial peptides, and

remodeling proteins. The encoded protein elicits crucial impacts on host defense, cell trafficking, immune modulation, and tissue repair, with a key role in the induction of innate immune defenses. This cytokine stimulates non-hematopoietic cells and promotes chemokine production thereby attracting myeloid cells to inflammatory sites. This cytokine also regulates the activities of NF-kappaB and mitogen-activated protein kinases and can stimulate the expression of IL6 and

and can stimulate the expression of IL6 and cyclooxygenase-2 (PTGS2/COX-2), as well as enhance the production of nitric oxide (NO). IL-17A plays a pivotal role in various infectious diseases, inflammatory and autoimmune disorders, and cancer. High levels of this cytokine are associated with several chronic inflammatory

diseases including rheumatoid arthritis, psoriasis and multiple sclerosis. The lung damage induced by the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) is to a large extent, a

result of the inflammatory response promoted by cytokines such as IL17A. [provided by RefSeq,
