<b>Sterility</b>	Products are supplied non-sterile. For cell culture applications, dilute in appropriate medium and sterile-filter (0.22 μm) prior to use.
<b>Background</b>	This gene encodes a CXC chemokine receptor specific for stromal cell-derived factor-1. The protein has 7 transmembrane regions and is located on the cell surface. It acts with the CD4 protein to support HIV entry into cells and is also highly expressed in breast cancer cells. Mutations in this gene have been associated with WHIM (warts; hypogammaglobulinemia; infections; and myelokathexis) syndrome. Alternate transcriptional splice variants; encoding different isoforms; have been characterized. [provided by RefSeq; Jul 2008]

Figure 1. CXCR4 protein is expressed on the surface of HEK293 cell membrane. Flow cytometry analysis with Anti-CXCR4 (DMC680) on HEK293 cells transfected with human CXCR4 (Blue histogram) or HEK293 transfected with irrelevant protein (Red histogram), and Isotype antibody on HEK293 transfected with irrelevant protein (Orange histogram).

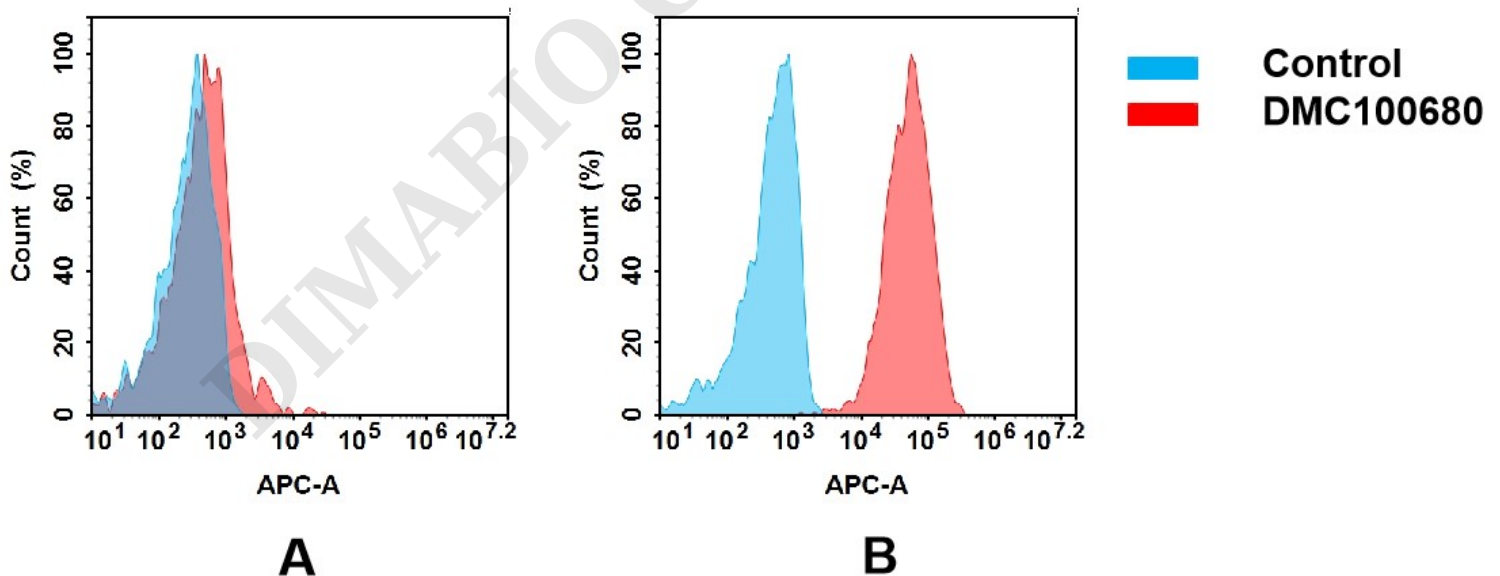

Figure 2. Flow cytometry analysis of antigen binding of anti-human CXCR4 mAb(DMC100680).

(A) DMC100680 does not bind to HEK293 cells that do not express CXCR4.

(B) A clear peak shift of DMC100680 was seen compared to the control when incubated with CXCR4-expressing Hela cells, indicating strong binding of DMC100680 to CXCR4. Antibodies were incubated at 5 µg/mL.
