

PRODUCT INFORMATION

C-Flag&Strep Tag Tag

CAC1C **Target**

CACH2, CACN2, CACNL1A1, CCHL1A1, CaV1.2, **Synonyms**

LQT8, TS, TS. LQT8

Human CAC1C-Strep full length protein-synthetic Description

nanodisc 6~8weeks

Delivery Uniprot ID Q13936 **HEK293 Expression Host**

Protein Families Ion Channels: Calcium

Protein Pathways

Background

The human full length CAC1C-Strep protein has a **Molecular Weight**

MW of 249 kDa

Lyophilized from nanodisc solubilization buffer (20 mM Tris-HCl, 150 mM NaCl, pH 8.0). Normally 5% Formulation & - 8% trehalose is added as protectants before Reconstitution lyophilization. Please see Certificate of Analysis

for specific instructions of reconstitution. Store at -20°C to -80°C for 12 months in lyophilized form. After reconstitution, if not intended for use within a month, aliquot and store

Storage & Shipping at -80°C (Avoid repeated freezing and thawing). Lyophilized proteins are shipped at ambient

temperature.

This gene encodes an alpha-1 subunit of a voltage-dependent calcium channel. Calcium channels mediate the influx of calcium ions into the cell upon membrane polarization. The alpha-1 subunit consists of 24 transmembrane segments and forms the pore through which ions pass into the cell. The calcium channel consists of a complex of alpha-1, alpha-2/delta, beta, and gamma subunits in a 1:1:1:1 ratio. There are multiple isoforms of each of these proteins, either

encoded by different genes or the result of alternative splicing of transcripts. The protein encoded by this gene binds to and is inhibited by dihydropyridine. Alternative splicing results in many transcript variants encoding different proteins. Some of the predicted proteins may not

produce functional ion channel subunits. [provided by RefSeq, Oct 2012]
