receptor cysteine-rich (SRCR) superfamily. Members of this family are secreted or membrane-anchored proteins mainly found in cells associated with the immune system. This

protein is a type-I transmembrane glycoprotein found on the surface of thymocytes; T lymphocytes and a subset of B lymphocytes. The encoded protein contains three SRCR domains and may act as a recenter to regulate T cell and may act as a receptor to regulate T-cell proliferation. Alternative splicing results in multiple transcript variants encoding different

isoforms.
