> The galectins are a family of beta-galactosidebinding proteins implicated in modulating cell-cell and cell-matrix interactions. The protein encoded by this gene is an S-type lectin. It is overexpressed in Hodgkin's disease tissue and

might participate in the interaction between the HandRS cells with their surrounding cells and **Background** 

might thus play a role in the pathogenesis of this disease and or its associated immunodeficiency. Multiple alternatively spliced transcript variants have been found for this gene.
